5.

## Appendix A

Appendix A illustrates semantic types that may be supported and their corresponding adaptive template names. For example, the Pipelined semantic type is made up of, in this order, the map\_keys the pipe\_state and the index\_fact adaptive templates. The example pre-parsed and post parsed SQL adaptive templates are then provided.

As mentioned previously, the use of the semantic types significantly reduces the amount of work needed to implement the datamart 150. By selecting a semantic type for a particular fact table or dimension table, the consultant automatically selects the corresponding pre-parsed SQL adaptive templates. The selected adaptive templates are then automatically converted into post parsed SQL statements that include the schema specific information for the datamart 150. Additionally, these post parsed SQL statements include the SQL for accessing and manipulating the datamart 150 tables.

-- Insert BOOKs for deltas with same dim keys OR for
-- brand new orders.
-- Note that we DON'T want to count Shipments
-- (so shipment ss key's should be different from
-- order ss_keys) since we just want bookings to sum up
-- to whatever this transcation says they should be.
-- Fact table should be indexed
-- WHERE clause prevents double booking on changed -- dimension - if we didn't use the NOT EXISTS clause
-- then this query would repeat the work of the last one
-- above - which we have already taken care of
-- HAVING clause ensures that multiple 0 records don't
-- get inserted whenever this procedure is run
-- Note that we increment the sequence number just in case
-- this new transaction occurs on the same date as the last
-- existing one in the fact table - to avoid index errors
-- IND: Insert New Delta

Form pairwise deltas for all rows except earliest for each sskey
-- Each row created in NFD will consist of two sequential entries from the
-- staing table. So if N enties for an order exist in MFL (after we have filtered
-- out same-date duplicates) then all the queries above will deal with the earliest entry,
whereas
-- all the queries below (including this one) will deal with the N-1 deltaing transactions
-- This query assumes that MFL will already have been filtered
-- to have a single record for each order/datekey
-- NFD: Not First Delta
